Angle Vocabulary

Angle – two rays that share a common endpoint, called the vertex

Vertex – endpoint of an angle

Sides of an angle – two rays that form an angle

Measure of an angle – a rotation from a ray to another, the smallest amount of rotation, the measurement of one ray to the next, in degrees

Reflex measure of an angle – largest amount of rotation between two rays less than 360 degrees

Angle congruence – two angles that have equal measures, two angles are congruent, if and only if (IFF)they equal measures

Angle bisector – a ray that splits an angle into two congruent angles

Degrees – unit of measurement for angles

Protractor – a tool to measure an angle

Angle Addition -
