

Here is another example of a composition of rotation and reflection transformations.

### EXAMPLE C

Given  $\triangle DEF$  with vertices:  $D(-4, 2)$ ,  $E(-1, 0)$ ,  $F(0, 6)$ . Reflect  $\triangle DEF$  across the line  $y = x$  to create  $\triangle D'E'F'$ . Rotate  $\triangle DEF$   $90^\circ$  clockwise about the origin to create  $\triangle D''E''F''$ . Reflect  $\triangle D''E''F''$  across the  $x$ -axis to create  $\triangle D'''E'''F'''$ .

- What is the transformation rule,  $(x, y) \rightarrow (?, ?)$ , that transforms  $\triangle DEF$  to  $\triangle D'E'F'$ ?
- What are the coordinates of the vertices of  $\triangle D'E'F'$ ?
- What are the coordinates of the vertices of  $\triangle D''E''F''$ ?
- What is the transformation rule,  $(x, y) \rightarrow (?, ?)$ , that transforms  $\triangle DEF$  to  $\triangle D''E''F''$ ?
- What are the coordinates of the vertices of  $\triangle D'''E'''F'''$ ?
- What is the single transformation rule that takes  $\triangle D''E''F''$  onto  $\triangle D'''E'''F'''$ ?
- What is the single transformation rule that takes  $\triangle DEF$  onto  $\triangle D'''E'''F'''$ ?

### Solution

**Step 1** Draw  $\triangle DEF$  on a set of axes and relocate its vertices by reflecting  $\triangle DEF$  across the line  $y = x$  to get  $\triangle D'E'F'$ . Earlier you discovered that a reflection across the line  $y = x$  switches the  $x$ - and  $y$ -values of each ordered pair thus it is equivalent to the ordered pair rule  $(x, y) \rightarrow (y, x)$ . Therefore  $D(-4, 2)$ ,  $E(-1, 0)$ ,  $F(0, 6)$  become  $D'(2, -4)$ ,  $E'(0, -1)$ ,  $F'(6, 0)$ .

**Step 2** Earlier you discovered that a rotation of  $90^\circ$  clockwise is equivalent to the ordered pair rule  $(x, y) \rightarrow (y, -x)$ . Relocating the vertices of  $\triangle DEF$  using the ordered pair rule gives us vertices  $D''(2, 4)$ ,  $E''(0, 1)$  and  $F''(6, 0)$ .

**Step 3** Earlier you discovered that a reflection across the  $x$ -axis is equivalent to the ordered pair rule  $(x, y) \rightarrow (x, -y)$ . Relocating the vertices of  $\triangle D''E''F''$  using the ordered pair rule gives us vertices  $D'''(2, 4)$ ,  $E'''(0, 1)$ , and  $F'''(6, 0)$ .

**Step 4** The ordered pair rule that takes  $\triangle DEF$  onto  $\triangle D''E''F''$  is  $(x, y) \rightarrow (y, -x)$ . The ordered pair rule that takes  $\triangle D''E''F''$  onto  $\triangle D'''E'''F'''$  is  $(x, y) \rightarrow (x, -y)$ . Thus the ordered pair rule that takes  $\triangle DEF$  onto  $\triangle D'''E'''F'''$  is  $(x, y) \rightarrow (y, -x) \rightarrow (y, x)$ , or simply  $(x, y) \rightarrow (y, x)$ . Notice, this is the same as the ordered pair rule  $(x, y) \rightarrow (y, x)$  that reflected  $\triangle DEF$  onto  $\triangle D'E'F'$ .  
 $(x, y) \rightarrow (x, -y)$

**Conclusion:**

The composition of a  $90^\circ$  CW(clockwise) rotation and a reflection across the  $x$ -axis is the same as a single reflection across the line  $y=x$ .
